|------------------|---------|------------|------------------------|
| Date | Version | Revised by | Revision Notes |
| 23.11.20 | 1.0 | Luke Snell | Initial Public Release |

How to Use this Document

This document has been created for people that are preparing to sit the CCNP Enterprise specialist exam "Implementing Cisco SD-WAN Solutions (300-415)". It contains a variety of "memory exercises" that you can utilise during your studies to prepare for the official certification exam. These exercises have been derived from materials that I used while preparing for the exam.

I firmly believe that familiarity with CLI syntax, the vManage GUI, and the Cisco SD-WAN API should be obtained through exposure to the technologies in a lab environment. So, with the exception of a handful of topics, no memory exercises contain command syntax or configuration "how to's". I have provided links to free and official Cisco resources that you can use to develop these skills if you do not have access to Cisco SD-WAN software.

To get the most out of this document you should scan through it and identify topics whose "details" you do not feel confident recalling under exam conditions. The first page of every "topic" details the answers and is followed by templates you can use to print out and complete.

Proceed to printing off a suitable number of each exercise to complete only once you have identified your strengths and weaknesses! Your weakest topics should have more exercises to complete so that you do not waste time revising topics you are already comfortable with. Try to use the concept of spaced repetition to optimize your exam revision preparation.

With the exception of two topics - no memory exercises contain command syntax or configuration processes. Familiarity with CLI syntax, APIs, and the vManage GUI should all be developing via practical lab exercises. You will need to know your show commands for the device administration section of this exam!

Finally, please note that this is one of *many* resources you should utilise when preparing for the certification exam. This resource should help you avoid losing easy points in the 50 or so questions that will be thrown at you in the exam, however without labbing each topic thoroughly it will be difficult to crack the more complex exam questions.

Best of luck with your Cisco SD-WAN journey!

- Luke Snell

Cisco SD-WAN Hardware

It is a good idea to understand device feature capabilities [e.g.: WLAN / LTE built in] and what deployment scenario the devices are best used for. You should refer to hardware data sheets and design documentation for this information.

Use this memory table just to understand the hardware models associated with each software chain.

| Viptela OS | Cisco IOS-XE |
|---------------------|---|
| vEdge Cloud | Catalyst 8000V Edge, CSR1000v |
| vEdge-100/100b/100m | ASR 1001-X / 1002-X |
| vEdge-1000 | Catalyst 8300 / 8500 Series |
| vEdge-2000 | ISR 1000 Series [excl. ISR1100-4G/6G/LTE] |
| vEdge-5000 | ISR 4000 Series |
| ISR 1100-4G/6G/LTE | ENCS 5000 |
| | IR-1100 [industrial router] |

ZTP Workflow

ZTP Workflow

- 1. Confirm Pre-Requisites
 - vManage has been configured and all certificates have been deployed
 - Control connections established between controllers
 - Full reachability to target site where vEdge is being deployed
 - vBond IP is reachable across the enterprise
 - vManage WAN Edge List is populated and the desired vEdge entry has been flagged as "staging" or "valid"
- 2. Deploy second vBond and configure it to act as a ZTP-server, ensure its IP address is publicly reachable across the enterprise.

 vbond <IP address of the ZTP server's transport interface> local ztp-server
- 3. Configure enterprise DNS servers to resolve ztp.viptela.com to the vBond ZTP Server's transport interface IP[s]
- 4. Create the ZTP chassis CSV or JSON [20.3.1+] file to following information:
 - chassis number
 - serial or token number
 - validity: either invalid, staging or valid
 - vBond IP:
 - [optional] vBond_Port
 - organization name
 - [optional] path_to_enterpriseCA

ZTP Workflow

5. Upload the ZTP chassis file with the command:

```
request device-upload chassis-file <location>
```

6. Verify the file entries were accepted and are valid:

```
show vtp entries
```

- 7. In vManage create a template for the vEdge device and attach it to its chassis/serial or chassis/token
- 8. [Optional] To enable ZTP Software Enforcement:
 - Go to Maintenance > Software Repository and upload Cisco SD-WAN images
 - Go to Administration > Settings and enable "Enforce Software Version [ZTP]", select which nodes you want to enforce image management on and then select the required image version
- 9. Power on the vEdge device at the target site & allow time for ZTP process

For enterprise managed certificate deployments the Root CA cert must be installed on vEdge and it must be preconfigured with system organization-name <ORG_NAME>

For vEdge-cloud devices, must use command activate vedge-cloud chassis-number <chassis_num> token <token> to start the ZTP process

If ZTP Software enforcement was enabled its transfer progress can be monitored via vManage Tasks

10. Verify vEdge device configuration aligns with device template and whether it is running the correct image version [if configured in Step 8]

ZTP Workflow

Only write down core concepts for each step

Cisco PnP Workflow

| Step | Action |
|------|--|
| 1 | vManage has a device template preconfigured |
| 2 | Node boots up and obtains DHCP IP/DNS/Default Gateway information on transport interface |
| 3 | Node queries devicehelper.cisco.com |
| 4 | Cisco PnP SaaS Service redirects to corporate vBond |
| 5 | vBond initiates control communication |
| 6 | Node receives vManage device template |

|--|---------|----------|---------|
| Public | Public | Public | Private |
| Public | Private | Public | Private |
| Private | Private | Public | Private |

NAT Types

| Туре | Comment |
|---|--|
| Full Cone / One-to-One NAT | Maps internal address/port pair to external address/port pair. |
| Address-Restricted Cone NAT [Restricted Cone NAT] | Permits outbound connections inwards IF-AND-ONLY-IF a session was established from the inside first. |
| Port Restricted Cone NAT | Stricter version of Restricted Cone NAT where ports are added to process. |
| | Unique external IP/port mapping created for each destination IP/port. |
| Symmetric NAT | Outbound connections permitted inwards only if inside network initiated stream. |
| | Only supported on one end of the tunnel and with One-to-One NAT. |

| wEdge A | wEdge B | IPSec Tun | nel Formed? |

OMP Route Attributes

| Attribute | Description |
|--|---|
| TLOC | Next-hop of the OMP route |
| Origin | Source of the route and may contain a protocol identifier |
| | Used for best path selection |
| Originator | System IP of advertiser – details where route learnt from |
| Preference | Higher = Better ; influences best path selection process |
| Service Indicates the service this route is tied to [if any] | |
| Site ID Should be unique per site, used for loop prevention | |
| Tag | Route Tag, transitive attribute not carried across redistribution |
| VPN | The VPN/VRF route was advertised FROM |
| AD | Not an OMP Attribute but RIB AD is: |
| | Viptela: 250 |
| | • IOS-XE: 251 |

OMP Route Attributes

| Attribute | Description |
|-----------|-------------|
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

| Attribute | Description |
|-----------|-------------|
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| _ | |
| | |

TLOC Route Attributes

| Attribute | Description |
|----------------------|---|
| TLOC Private Address | Contains private IP address of the wEdge interface |
| TLOC Public Address | STUN used to notify wEdge if behind NAT - will represent post NAT address in this case. If same as private address then wEdge not behind NAT. |
| Color | Color of transport |
| Encapsulation Type | GRE or IPSec, must match on both sides of tunnel |
| Preference | Higher = Better, used for path selection |
| Site ID | Identifies originator & used with IPSec tunnel construction |
| Tag | Route tag |
| Weight | Higher = Better, used for path selection, locally significant |

TLOC Route Attributes

| Attribute | Description |
|-----------|-------------|
| | |
| | |
| | |
| | |
| | |
| | |
| | |

| | |
| | |
| | |
| | |
| | |
| | |
| | |

Service Route Attributes

| Attribute | Description | |
|---------------|---|--|
| VPN ID | VPN service belongs to | |
| Service ID | Identifies service type being advertised: | |
| | FW: Firewall [svc-id1] | |
| | IDS: Intrusion Detection System [svc-id2] | |
| | IDP: Identity Provider [svc-id3] | |
| | netsvc1-4: custom, maps to svc-id 4-7 respectively | |
| Label | Substitute label for OMP routes who must be redirected to | |
| | the service | |
| Originator ID | System IP address of advertising node | |
| TLOC | Identifies where the service is located | |
| Path ID | Identifies the OMP Path | |

Service Route Attributes

| Attribute | Description |
|-----------|-------------|
| | |
| | • |
| | |
| | • |
| | • |
| | |
| | |
| | |
| | |
| | |

| | • |
| | |
| | |
| | |
| | |

OMP Best Path Selection

| Step | Operation |
|------|---|
| 1 | Confirm OMP route is valid |
| 2 | Prefer locally sourced OMP routes to vSmart sourced OMP routes |
| 3 | Prefer lower AD routes |
| 4 | Prefer higher OMP preference |
| 5 | Prefer higher TLOC preference |
| 6 | Prefer the origin whose default AD is lower [e.g.: Static beats iBGP] |
| 7 | Prefer lowest Origin metric |
| 8 | Prefer highest System IP |
| 9 | Prefer highest TLOC private address |

OMP Best Path Selection

| Step | Operation |
|------|------------------|
| 1 | |
| 2 | |
| 3 | |
| 4 | |
| 5 | |
| 6 | |
| 7 | |

Policy Lists

| Name | Purpose |
|-------------|---|
| Application | Match on an application / app family |
| Colour | Specify a single colour or colour group |
| Prefix | Match routing info in control plane specifically |
| Data Prefix | Match data in the data plane specifically |
| Site | Matching criteria to determine where policy application occurs |
| Policers | Limit ingress/egress traffic, cannot match off |
| SLA Class | Defines loss, latency and jitter that a class of traffic experience |
| TLOC | Used to manipulate next-hop of traffic forwarded |
| VPN | Service-side VPNs for which data policy should be applied to |

Policy Lists

Packet Forwarding Order of Operations

| Step | Operation |
|------|--|
| 1 | IP Destination Lookup |
| 2 | Ingress Interface ACL |
| | If denied then drop packet |
| 3 | Application-Aware Routing |
| | Requires equal cost multipath (ECMP) routes in routing table |
| 4 | Centralized Data Policy |
| | Can override Step 3 decision |
| 5 | Routing and Forwarding |
| 6 | Security Policy |
| | Firewall > Intrusion Prevention > URL-Filtering > AMP |
| 7 | Encapsulation and Encryption |
| 8 | Egress Interface ACLs |
| | Changes occur prior to packet forwarding |

| Step | Operation |
|------|------------------|
| 1 | |
| 2 | |
| 3 | |
| 4 | |
| 5 | |
| 6 | |
| 7 | |
| 8 | |

| Step | Operation |
|------|-----------|
| 1 | |
| 2 | |
| 3 | |
| 4 | |
| 5 | |
| 6 | |
| 7 | |
| 8 | |

vManage NMS Services & Local Clustering

| Server / Service | Used For |
|------------------------|---|
| Application Server | Web GUI, APIs – uses Wildfly |
| Statistics Database | Elasticsearch database for stats, audit logs, alarms, and events |
| Configuration Database | Stores config info, policies, templates, certificates. |
| Messaging Server | Kafka server that exchanges messages between vManage devices in a cluster |
| SD-AVC | "Software Defined Application Visibility and Control" Optional service |

Greenfield Clustering Process

- 1. Plan for 3x vManage deployment odd number required for quorum
- 2. Reserve & allocate 1G/10G interface on host for vManage cluster comms
- 3. Configure cluster interface in VPN 0 with an IP and no tunnel-interface
- 4. Configure "primary" node administration settings + certificates
- 5. Add "primary" node to the cluster in Administration > Cluster Configuration by adding its cluster interface IP and specifying admin credentials
- 6. Wait for cluster configuration process to complete, be patient.

Monitor NMS Service Restart: request nms all status
Monitor via vShell: show log vmanage-server.log tail N

- 7. Repeat steps 5 & 6 for subsequent cluster nodes
- 8. Once all nodes have joined the cluster onboard them as controllers via the primary node by generating CSR & installing their signed certificate.

vManage NMS Service & Clustering

| Server / Service | Used For |
|------------------------|----------|
| Application Server | |
| Statistics Database | |
| Configuration Database | |
| Messaging Server | |
| SD-AVC | |

| Greenfield Clustering Process |
|-------------------------------|
| 1. |
| 2. |
| 3. |
| 4. |
| 5. |
| 6. |
| 7. |
| 8. |

SD-WAN Syslog

| File Name | Used For |
|-----------|--|
| auth.log | login, logout, superuser access events, usage of authorization systems |
| kern.log | kernel messages |
| messages | Consolidated log file containing syslog from all sources |
| vconfd | Configuration logging |
| vdebug | Storing running debugs – cannot be remotely sent |
| vsyslog | Viptela daemons |

SD-WAN Syslog

| File Name | Used For |
|-----------|----------|
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

| File Name | Used For |
|-----------|----------|
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

Application Aware Routing

| AAR Component | Use |
|-------------------------|--|
| Hello Interval | Frequency Hello is sent across a tunnel, default 1000 ms |
| Hello Multiplier | Number of BFD Hellos lost before declaring tunnel down, default 7 |
| App-Route Poll Interval | Period of time used to calculate loss, latency and jitter from BFD |
| | Also known as "buckets" |
| | Be careful with config else results may not be statistically significant |
| App-Route Multiplier | Determines circuit health by evaluating results from App-Route Poll |
| | Intervals, default is 6 buckets |

| Step | Configuration Action | |
|------|------------------------------------|--|
| 1 | Define SLA Parameters | |
| 2 | Define Application Lists | |
| 3 | Define Sites, Prefixes and VPNs | |
| 4 | Define the AAR Policy | |
| 5 | Apply AAR Policy to Selected Sites | |

| Scenario | Result |
|---|--|
| No tunnels match SLA | Distribute traffic among compliant tunnels |
| | |
| Single tunnel matches SLA | Send traffic through the compliant tunnel |
| Multiple tunnels match SLA | Revert to backup-sla-preferred-color if configured |
| | Last resort - send traffic through any available transport |
| AAR requires at least 2 equal cost routes installed in the routing table to work! | |
| Max 4 SLA classes per vEdge | |

Application Aware Routing

| AAR Component | Use |
|---------------|-----|
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |

| Step | Configuration Action |
|------|----------------------|
| 1 | |
| 2 | |
| 3 | |
| 4 | |
| 5 | |

| Scenario | Result |
|----------|--------|

Quality of Service [QoS]

| Action | Comment |
|----------------|---------|
| Classification | |
| Policing | |
| Scheduling | |
| Rewriting | |

| QoS Policy | Notes |
|------------------|---|
| Centralized Data | Outbound direction = Service Class VPN to WAN Inbound Direction = WAN to Service Class VPN Enables QoS at a site level and supports DPI |
| Localized Data | Outbound direction = Service Class VPN to WAN Inbound Direction = WAN to Service Class VPN Enables QoS at a site level and supports DPI |

| Step | Action |
|------|---|
| 1 | Define groups of interest: |
| | Class Map |
| | [Optional] Policer to either drop or remark |
| 2 | Create QoS Map by linking Class Map to Queues, specify bandwidth/buffer |
| 3 | [Optional] Create QoS Rewrite Policy |
| 4 | Create ACLs to match traffic and classify / police traffic |

QoS Treatment on wEdges - Part 1

| Action | Comment |
|----------------|---------|
| Classification | |

REST API Monitoring

| HTTP Method | Action |
|-------------|---------------------------------------|
| GET | Retrieves an object |
| POST | Creates an object, requires JSON body |
| PUT | Updates an object, requires JSON body |
| DELETE | Deletes an object |

Using the SD-WAN REST API

- 1. Identify what you want to monitor
 - vManage
 - o Alarms Details, Events, Server Info
 - SD-WAN devices
 - o Device Details, Device Statistics Details, Interface Statistics
 - Security
 - o ipsalert, Umbrella, Umbrella Patterns, URL Filtering
 - Traffic
 - o Application-Aware Routing, cFlowd Flows, DPI, Flow Log, QoS
- 2. Review relevant API docs via https://<vmanage>/apidocs
- 3. Authenticate to vManage via https://<vManage>/j security check
 - **Header:** Content-Type : application/x-www-form-urlencoded
 - Body: j username , j password
- 4. Make appropriate calls to retrieve data
